Do not make any mention of this problem until July 17, 2021, 6:00 p.m. JST. In case of violation, compensation may be demanded. After the examination, you can reveal your total score and grade to others, but nothing more (for example, which problems you solved).

Problem Statement

We have A balls and B balloons. Takahashi will repeatedly remove one ball until the number of balls is at most C times the number of balloons. Find the number of balls that will eventually remain, divided by the number of balloons.

Constraints

- $1 \leq A, B, C \leq 10^4$
- A, B, and C are integers.

Input

Input is given from Standard Input in the following format:

$A\ B\ C$

Output

Print the answer.
It will be considered correct when its absolute or relative error from our answer is at most 10^{-6}.

Sample 1

Input	Output
`8 3 2`	`2.000000000000000`

Initially, we have 8 balls.
Takahashi will repeatedly remove a ball until we have not more than 6 balls, after which we will have 6 balls.
Thus, the answer is $\frac{6}{3} = 2$.

Sample 2

Input	Output
`8 5 2`	`1.600000000000000`

We already have $8 \leq 5 \times 2$ in the beginning, so Takahashi will not remove any ball.
Thus, the answer is $\frac{8}{5} = 1.6$.
