

Problem H. How many ways?

Time Limit 1000 ms
Mem Limit 131072 kB
OS Linux

?

Write a program which identifies the number of combinations of three integers which satisfy the following conditions:

- You should select three distinct integers from 1 to n .
- A total sum of the three integers is x .

For example, there are two combinations for $n = 5$ and $x = 9$.

- $1 + 3 + 5 = 9$
- $2 + 3 + 4 = 9$

Input

The input consists of multiple datasets. For each dataset, two integers n and x are given in a line.

The input ends with two zeros for n and x respectively. Your program should not process for these terminal symbols.

Constraints

- $3 \leq n \leq 100$
- $0 \leq x \leq 300$

Output

For each dataset, print the number of combinations in a line.

Input	Output
5 9 0 0	2
